

Badingham

Estimated Parish Level Greenhouse Gas (GHG) Emissions 2017/18

What are we looking at?

The graphs that follow show the estimated 2017/18 greenhouse gas emissions for:

- **Badingham** (Local Authority district: *East Suffolk*)

The graphs show emissions estimated using two methods:

- **Territorial-based** emissions: the emissions that come from activities carried out *in* the parish
- **Consumption-based** emissions: the emissions that come from the production of the goods and services we consume, wherever they are emitted

The per-household emissions for each parish are also compared with the per-household emissions for the district in which the parish sits. This lets us see how above or below ‘average’ for our district we are.

The data used comes from a University of Exeter/Centre for Sustainable Energy (CSE) [project](#) and they combine:

- data that can be measured at parish level (e.g. metered gas & electricity) and
- data that are estimated for each Parish based on the kinds of people that live there (Census data) as well as the local transport infrastructure, land-use and local business/commercial activity.

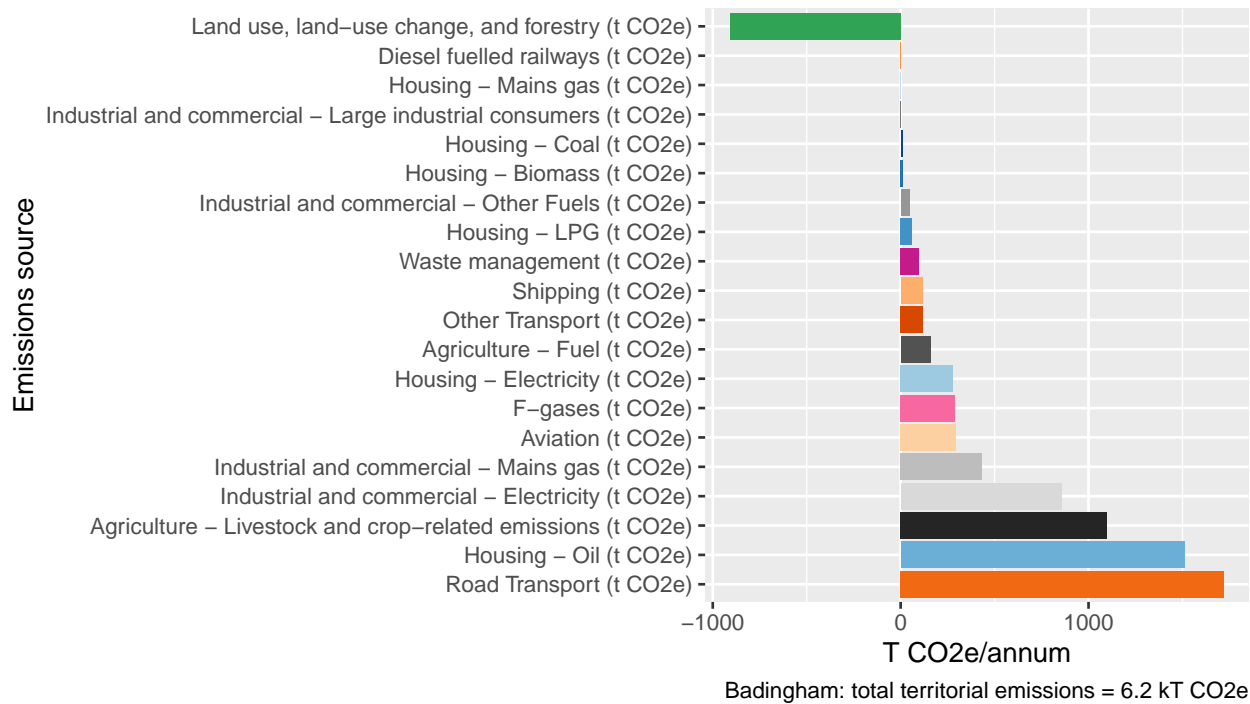

The data are a snapshot of emissions for 2017/18 and so should be seen as a pre-pandemic baseline.

The parish level **territorial** estimates are perhaps best used to paint a broad brush picture of ‘the big things’ that are *likely* to be the main parish level emissions sources. Sometimes this might highlight major through-roads as large emissions sources which can seem unfair if most of the traffic is from ‘out of parish.’ It can also identify a local industrial or agricultural activity as a major source. The parish may not think it can influence this but it could lead to constructive discussions with those businesses (for example).

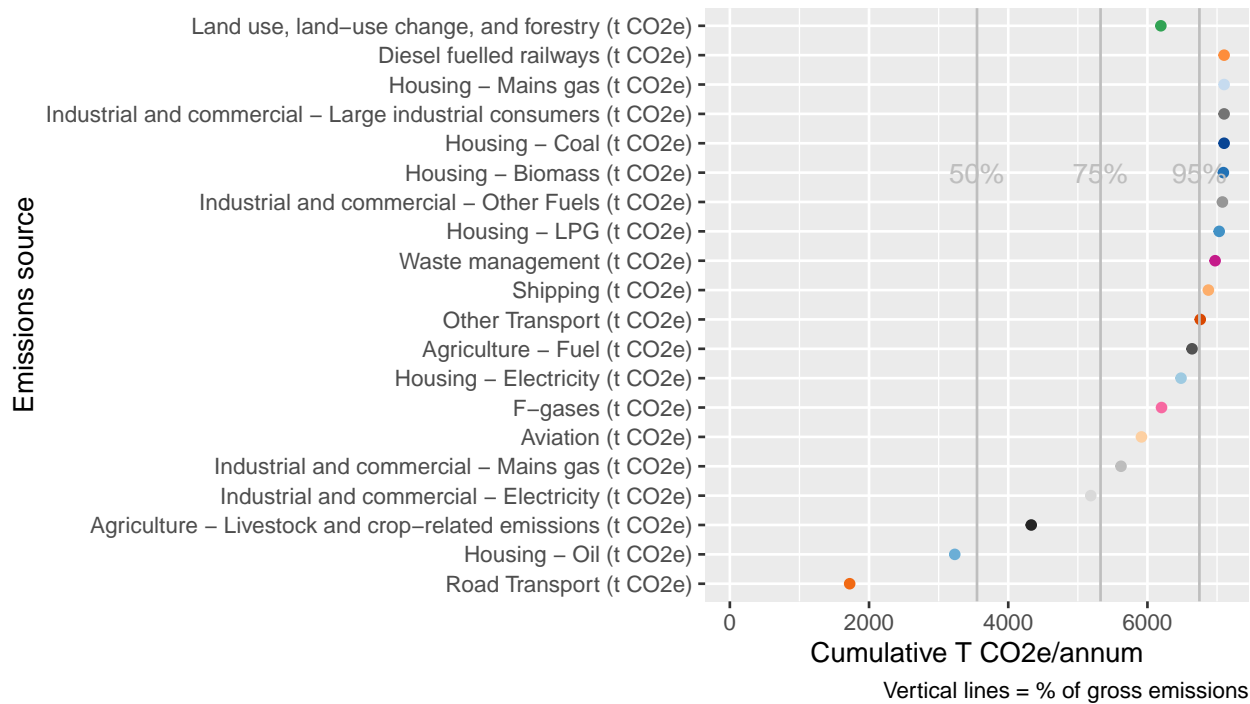

The **consumption** estimates are best used to show which aspects of the parish residents’ consumption are *likely* to be the biggest contributors to overall emissions. This helps us identify a) what we should try to do or use less of and b) how we could deliberately spend in ways that reduce our emissions footprint. It should *always* be remembered that apart from measured energy use, these are estimates and averages - if 100% of the parish never fly and never eat meat/fish then the estimated parish footprints will be wrong...

See the [CSE guidance on using the data](#) for more explanation.

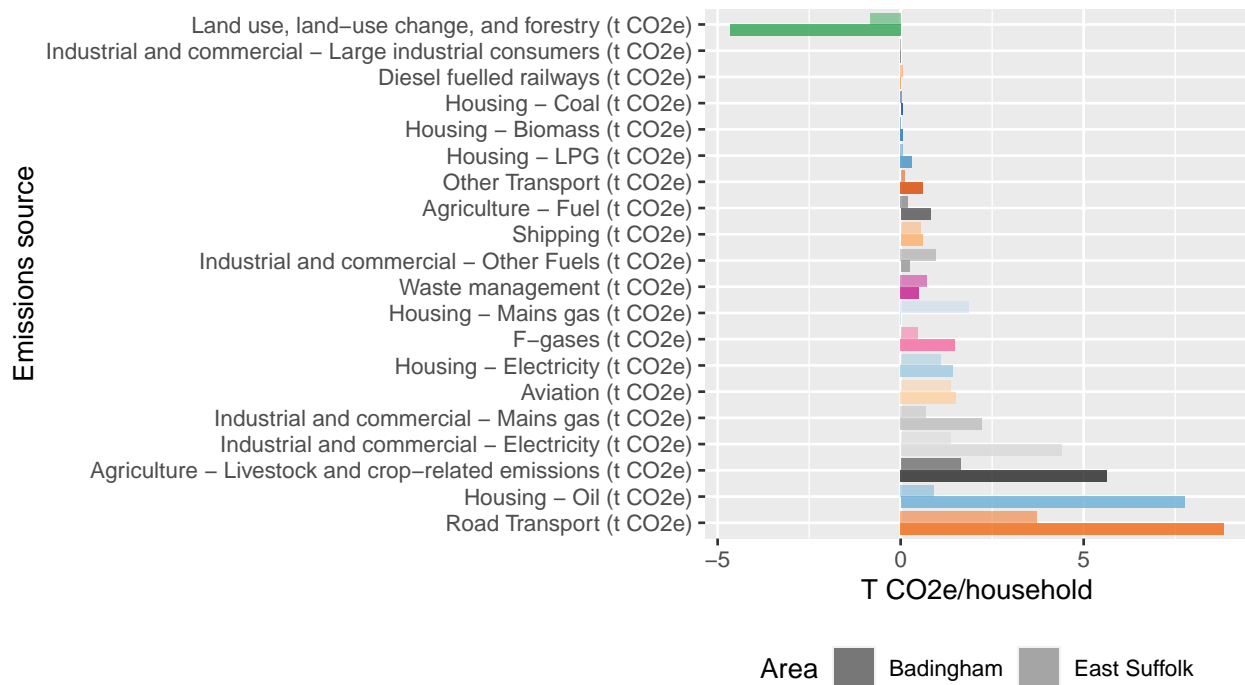

Which are our biggest territorial emissions sources?

Which big sources make up 50%, 75% or 95% of our territorial emissions?

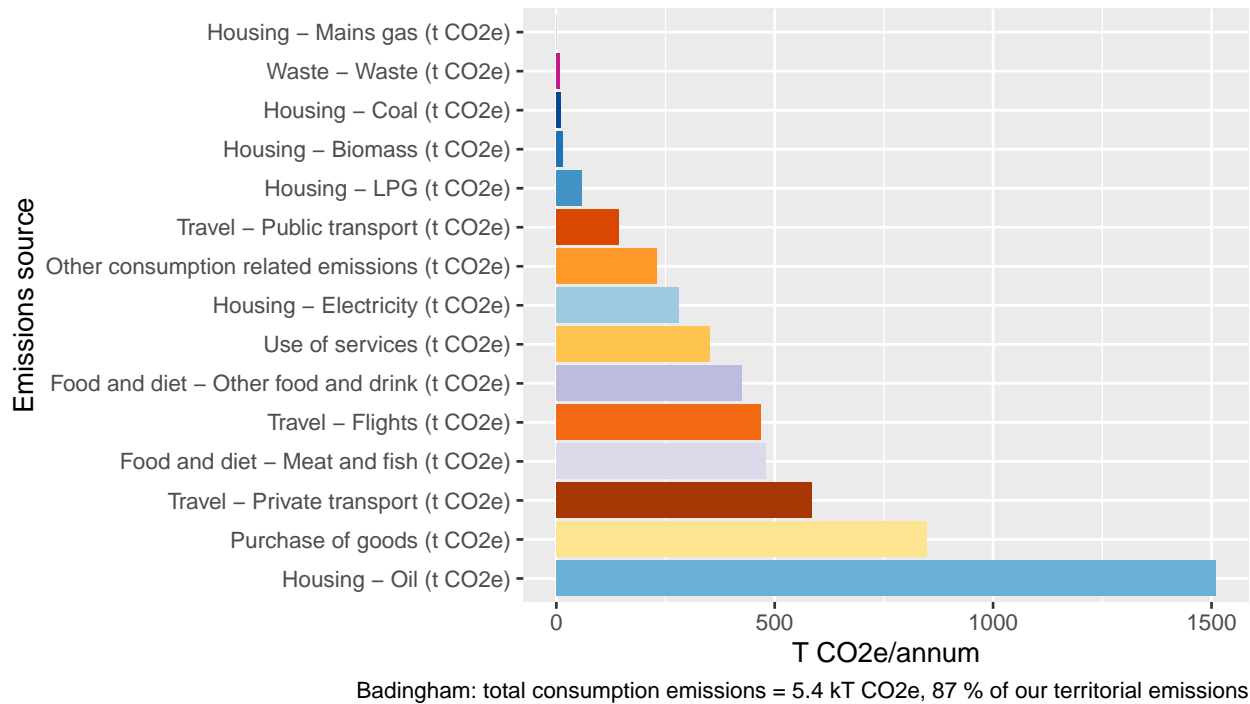

How do our per household territorial emissions compare with our district?

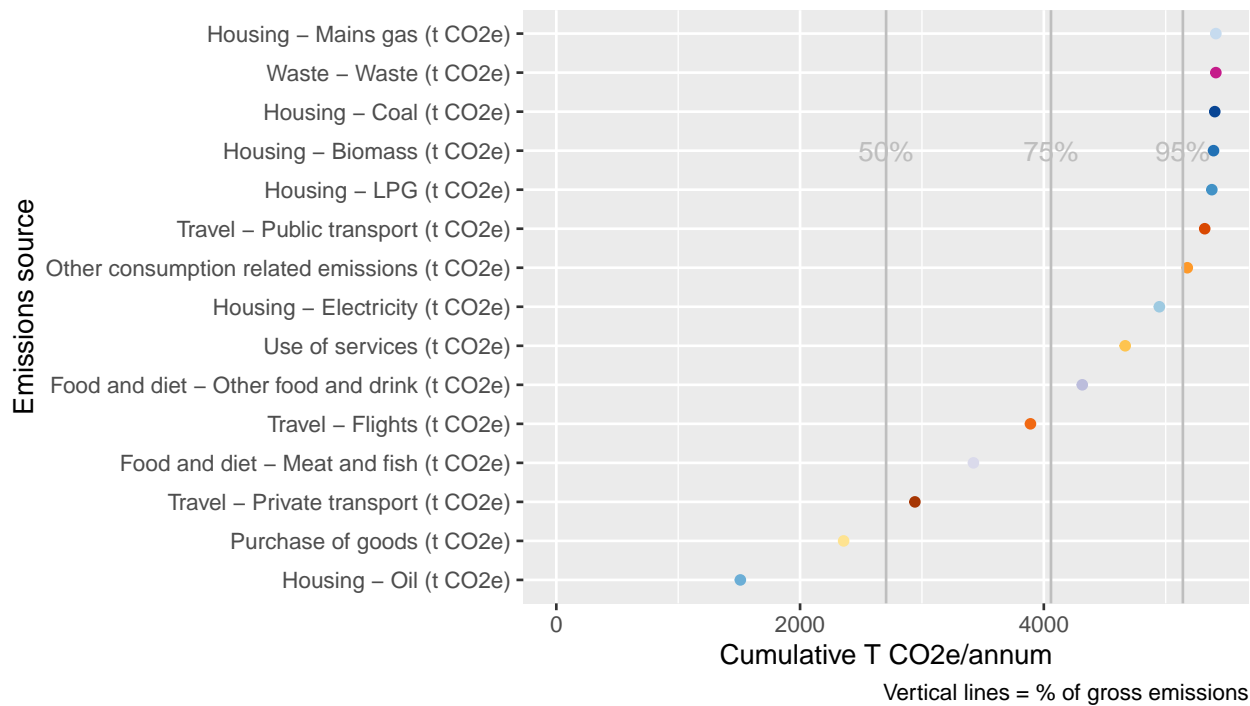

For comparison:

- Badingham total per household territorial emissions = 31.8 T CO2e
- East Suffolk total per household territorial emissions = 15 T CO2e

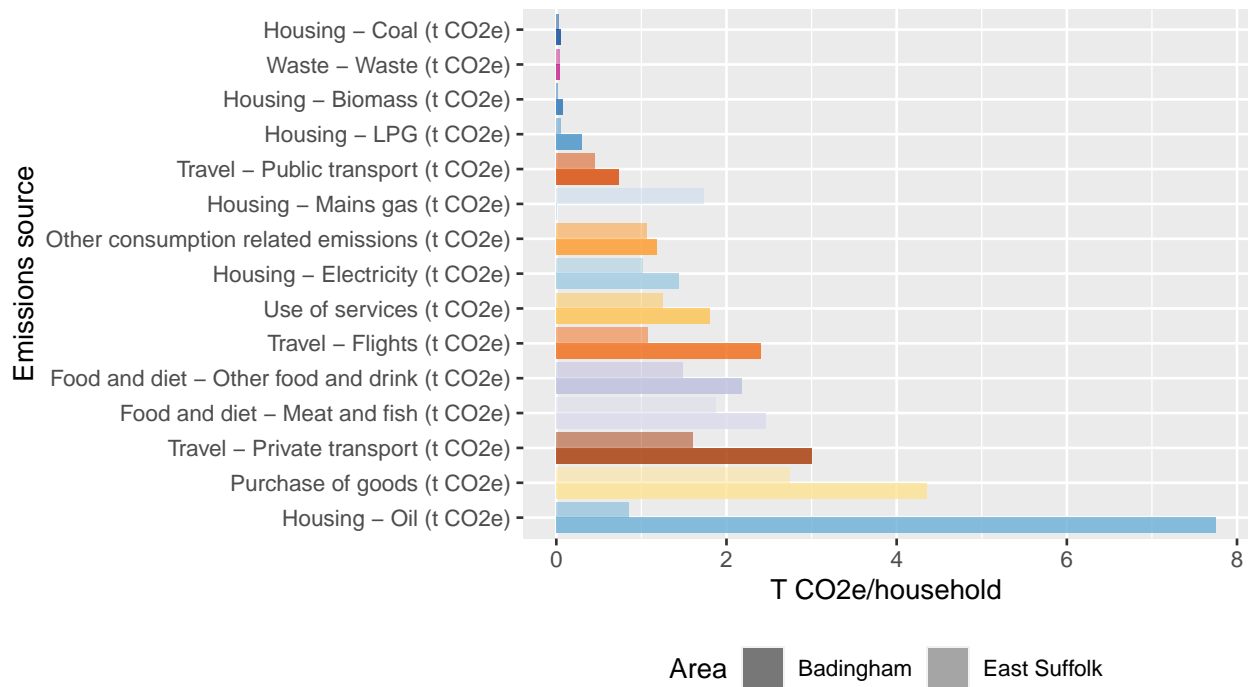

Which are our biggest consumption emissions sources?

Which big sources make up 50%, 75% or 95% of our consumption emissions?

How do our per household consumption emissions compare with our district?

For comparison:

- Badingham total per household consumption emissions = 27.8 T CO2e
- East Suffolk total per household consumption emissions = 15.3 T CO2e

Data tables

The parish data tables used to create the plots - if you need the numbers.

Territorial emissions

Table 1: Parish territorial emissions

| id | name | variable | value |
|-----------|-----------|---|---------|
| E04009368 | Badingham | Housing - Mains gas (t CO2e) | 0.0 |
| E04009368 | Badingham | Housing - Electricity (t CO2e) | 280.3 |
| E04009368 | Badingham | Housing - Oil (t CO2e) | 1,510.0 |
| E04009368 | Badingham | Housing - LPG (t CO2e) | 58.5 |
| E04009368 | Badingham | Housing - Biomass (t CO2e) | 13.8 |
| E04009368 | Badingham | Housing - Coal (t CO2e) | 10.4 |
| E04009368 | Badingham | Industrial and commercial - Electricity (t CO2e) | 855.9 |
| E04009368 | Badingham | Industrial and commercial - Mains gas (t CO2e) | 433.7 |
| E04009368 | Badingham | Industrial and commercial - Other Fuels (t CO2e) | 46.5 |
| E04009368 | Badingham | Industrial and commercial - Large industrial consumers (t CO2e) | 0.0 |
| E04009368 | Badingham | Agriculture - Fuel (t CO2e) | 158.0 |
| E04009368 | Badingham | Agriculture - Livestock and crop-related emissions (t CO2e) | 1,099.1 |
| E04009368 | Badingham | Aviation (t CO2e) | 293.7 |
| E04009368 | Badingham | Shipping (t CO2e) | 117.0 |
| E04009368 | Badingham | Diesel fuelled railways (t CO2e) | 0.0 |
| E04009368 | Badingham | F-gases (t CO2e) | 288.5 |
| E04009368 | Badingham | Road Transport (t CO2e) | 1,721.6 |
| E04009368 | Badingham | Other Transport (t CO2e) | 118.0 |
| E04009368 | Badingham | Waste management (t CO2e) | 96.8 |
| E04009368 | Badingham | Land use, land-use change, and forestry (t CO2e) | -909.0 |

Consumption emissions

Table 2: Parish consumption emissions

| id | parish | variable_n | value |
|-----------|-----------|---|---------|
| E04009368 | Badingham | Purchase of goods (t CO2e) | 847.4 |
| E04009368 | Badingham | Use of services (t CO2e) | 352.1 |
| E04009368 | Badingham | Other consumption related emissions (t CO2e) | 229.3 |
| E04009368 | Badingham | Food and diet - Meat and fish (t CO2e) | 480.3 |
| E04009368 | Badingham | Food and diet - Other food and drink (t CO2e) | 425.3 |
| E04009368 | Badingham | Housing - Mains gas (t CO2e) | 0.0 |
| E04009368 | Badingham | Housing - Electricity (t CO2e) | 280.3 |
| E04009368 | Badingham | Housing - Oil (t CO2e) | 1,510.0 |
| E04009368 | Badingham | Housing - LPG (t CO2e) | 58.5 |
| E04009368 | Badingham | Housing - Biomass (t CO2e) | 13.8 |
| E04009368 | Badingham | Housing - Coal (t CO2e) | 10.4 |
| E04009368 | Badingham | Travel - Flights (t CO2e) | 467.7 |
| E04009368 | Badingham | Travel - Public transport (t CO2e) | 142.8 |
| E04009368 | Badingham | Travel - Private transport (t CO2e) | 584.8 |
| E04009368 | Badingham | Waste - Waste (t CO2e) | 8.7 |
